

OPEN IT	<code>conductor up</code> → opens the cockpit at <code>localhost:7591</code> . Or <code>conductor</code> for a quick terminal table.
STATUS DOTS	<code>working now</code> <code>open (idle)</code> <code>recent</code> <code>idle</code>
REPLY TO ONE	Type in a card's box and press <code>↵</code> , or tap a quick button: <code>Yes</code> <code>No</code> <code>Continue</code> <code>Review</code> <code>Re-iterate</code> <code>Test+deploy</code>
PROMPT ALL	Use the ⚡ Prompt all managed bar at the top to message every managed window at once.
NEW WINDOW	+ New window button (name + folder), or <code>conductor run <name></code> . It launches in tmux and auto-accepts the trust prompt.
ADOPT EXISTING	Reply on any plain window's card to pull it under control, or <code>conductor adopt <id></code> . Then close the original tab.
TYPE A LOT	<code>conductor attach <name></code> drops you into the window to type long commands directly.
FROM ANY AGENT	It's an MCP server too: "use conductor to list my sessions / what's left?"

How control works: a reply goes to the window's Claude session running in **tmux** — watch the response in the card's "doing now" line, or `conductor attach` to see it live. Plain terminal windows can't take input directly, so replying to one **adopts** it (forks it into a managed copy) first.
